

The Brownfield Toolkit

Turn legacy compliance debt into a scored, audit-ready remediation plan: clause by clause, without the rewrite.

-60%

Remediation effort

-90%

Time for documentation

Any format, any language: firmware docs, PDFs, IFUs, code

Every gap traced to the exact clause behind it

From a live deployment, consumer health enterprise.

Valuable software, trapped by regulatory debt.

Regulated manufacturers carry legacy product lines that sit outside any compliance system of record. Reconstructing requirements, risk and verification evidence by hand is consulting work, billed hourly. It gets deferred for years while the regulatory target keeps moving.

Market expansion

Certified product, new jurisdiction. The technical file was never built for the new framework.

New regulation

Same product, same market. But the rulebook changed underneath it.

M&A due diligence

Acquired legacy assets, someone else's process. Nobody knows where the real gaps are.

How we address it

01

Target

Pick the regulatory framework to assess against: FDA, MDR/IVDR, UK.

02

Ingestion

Legacy assets ingested as-is: code, docs, risk files, IFUs.

03

Gap analysis

Every artifact mapped to the framework; every gap identified.

04

Remediation

A structured plan: actionable tasks, clause by clause.

Why it works

Agentic AI, not a black box

The assessment shows its work. Every gap cites the clause behind it.

Your team stays in control

Agentic AI runs the assessment. Your team reviews and executes the plan.

In your own templates

Remediation plans and Technical Files, generated in the format your QMS already uses.

The benchmark

	P4SaMD	ALM / RIM	Consultants	Spreadsheets
Handles unstructured legacy data	✓	×	Manual	Manual
Time to first result	Days	N/A	Weeks+	Weeks+
Stays current automatically	✓	Partial	×	×
Traceable to the exact clause	✓	Partial	Depends	Manual

Three regulatory clocks are already running

Wherever the trigger comes from, the assessment starts the same way. Here's where Brownfield Remediator applies today, with a first checklist to gauge where you stand.

EU · MDR/IVDR

Never built for CE. Now it has to be.

Technical files, risk files and test evidence were never structured for MDR/IVDR conformity. Identifying the gaps by hand is slow and expensive, and still fails audits without full traceability.

READINESS CHECKLIST

- ☐ Device qualification & Rule 11 software classification confirmed
- ☐ Risk management file aligned to ISO 14971
- ☐ Clinical evaluation plan drafted, evidence gaps identified
- ☐ Technical documentation mapped to Annex II/III
- ☐ Software lifecycle file aligned to IEC 62304, usability to IEC 62366-1
- ☐ Cybersecurity assessment complete (MDCG 2019-16 / IEC 81001-5-1)
- ☐ UDI, labelling & EUDAMED registration ready
- ☐ QMS in place with a PRRC designated; post-market surveillance (PSUR/PMCF) plan active

EU · AI ACT

TOP PRIORITY

High-risk AI, shipping today

Annex I high-risk requirements apply from 2 August 2028. Shipped AI-enabled SaMD needs a scored path to conformity, not a freeze on development while the clock runs.

READINESS CHECKLIST

- ☐ Role & high-risk route documented (Art. 6: MDR-linked or standalone use case)
- ☐ AI literacy program running; prohibited-practices screening on file (Art. 4, 5)
- ☐ Risk management system mapped to Art. 9
- ☐ Data governance for training/validation/testing datasets evidenced (Art. 10)
- ☐ Technical documentation aligned to Annex IV
- ☐ Human oversight & "stop" function designed (Art. 14)
- ☐ Transparency disclosures evidenced where the system interacts with people or generates content (Art. 50)
- ☐ Conformity route, EU declaration & CE marking confirmed; post-market monitoring & incident reporting mapped (Art. 43, 47, 48, 72, 73)

IEC 62304

Edition 2 is coming. Quietly.

Edition 2 is in its final drafting stage (FDIS), expected to publish in 2028. Regulatory recognition typically follows over the next few years. Teams that start mapping now arrive ready when it becomes binding.

READINESS CHECKLIST

- ☐ Classification ready to map toward new Process Rigor Levels
- ☐ AI/ML-containing processes flagged ahead of new AI Development Lifecycle
- ☐ Software development plan & lifecycle model documented against the current baseline
- ☐ Verification and problem-resolution records traceable to requirements
- ☐ Configuration management / version control process in place
- ☐ Cybersecurity controls cross-checked against design controls as current baseline
- ☐ Legacy software transition plan drafted

NEXT: SUCCESS CASE

How one team assessed three frameworks in three weeks.

SUCCESS CASE

Digital health · AI clinical documentation

Three frameworks, three weeks, one root cause.

A healthcare provider had an AI-assisted clinical documentation product in production and no in-house regulatory team. Brownfield Remediator told them how compliant it really was, in a 3-week proof of concept.

71

Requirements evaluated

prioritized**3**Frameworks: MDR, AI Act,
IEC 62304**3 wks**Proof of concept, end to
end

At a glance

CLIENT

A healthcare provider running an AI-assisted clinical documentation product already in production, with no dedicated in-house regulatory team.

CHALLENGE

Prove compliance with EU MDR, the EU AI Act and IEC 62304 for a product built and shipped before those obligations existed, without months of consultant-led review.

→ APPROACH

A 3-week proof of concept: import existing technical and documentation assets as-is, evaluate them clause by clause against all three frameworks, deliver an estimated remediation plan.

✓ OUTCOME

71 requirements assessed, 43 confirmed gaps identified and prioritized, and one unratified internal decision uncovered as the root cause behind most of them.

The challenge

The product was built, in market and in real clinical use, with AI/ML features that pulled it into SaMD-adjacent regulatory scope. Its technical file, risk file and documentation had grown organically over time: a *brownfield* asset base of legacy software, never structured around any single regulatory framework.

With EU MDR Class I self-declaration obligations now layered with EU AI Act requirements, the team faced a question common across digital health and medtech. Answering it manually takes niche expertise across MDR, AI Act and IEC 62304: expensive to apply consistently across dozens of documents and technical assets, and hard to keep current as the product evolves.

THE QUESTION

How compliant is the product today, what exactly is missing, and how much effort will it take to close the gap?

The solution

A structured, time-boxed proof of concept on P4SaMD's Brownfield Remediator, in place of a manual, consultant-led review.

01

Scoping and contracting **SCOPE**

A lightweight, no-cost 3-week engagement: a dedicated project workspace with read-only access. No rebuild of the product required to start.

02

Asset collection and framework setup **WEEK 1**

Existing technical assets (exported, no live repo access) and documentation such as intended-use statements, risk files, SOPs and prior assessments were uploaded into Brownfield Import. MDR, EU AI Act and IEC 62304 were configured.

03

Evaluation **WEEKS 2-3**

Every requirement evaluated against the configured frameworks with full supporting evidence. Each finding traceable to the specific clause it fails, not to a generic checklist.

04

Results readout **DELIVERY**

Findings delivered through a live, explorable dashboard alongside a formal gap-assessment report.

Results & impact

WHAT THE CLIENT VALUED MOST

One root cause behind most findings.

Rather than 43 disconnected issues, the assessment traced part of them back to a single unrati ed internal decision: that the device wasn't high-risk AI. It had quietly de-scoped a wide set of obligations.

3 weeks, not months

71 requirements evaluated across three frameworks. A manual review would take months.

43 gaps, prioritized

Confirmed gaps turned into a remediation roadmap, each traceable to the exact clause it fails.

New exposure surfaced

Genuine blind spots: clauses the team hadn't been tracking at all, not just items they had deprioritized.

Well under estimate

The engagement came in well below the roughly 700-hour manual estimate for this scope.

CLIENT FEEDBACK

Low-friction and high-signal: no cost for the core sessions, a dedicated read-only workspace, and a result the team could act on immediately. They reviewed findings in the live dashboard rather than the PDF, for the level of detail, and asked to extend access.

LOOKING AHEAD

The client plans to revisit the assessment as it considers a new device class, with early interest in:

IEC 62304 new edition

ISO 42001
