

MIA CARE + M+edisanté

Enable a cloud-native Healthcare Platform

FOR SEAMLESS MEDICAL DEVICE
INTEROPERABILITY

mia-care.io

medisante-group.com

In today's fast-paced world, healthcare providers are faced with the challenge of managing an increasing number of medical devices while maintaining a high level of patient care. The solution to this challenge lies in the power of digital platforms. A digital platform can streamline the management of medical devices and provide real-time data on their usage, which can be used to improve patient outcomes and reduce costs.

Implementing a digital platform can be an intimidating prospect for healthcare providers. Developing a digital platform from scratch can be a burdensome process, requiring significant time and resources.

It involves not only building the software, but also integrating it with existing medical devices, complying with regulatory requirements, and ensuring data security.

However, the benefits of a digital platform outweigh the burden of developing one. With a digital platform, healthcare providers can:

- centralize medical device management, reducing the risk of errors and improving efficiency;
- monitor device usage in real time, enabling proactive maintenance and reducing downtime;
- provide valuable insights into device usage patterns, which can inform purchasing decisions and improve patient care.

But how to cope with multiple medical device integration? There are many types and categories of medical devices, as well as several manufacturers using different technologies and connection frameworks. Even using cutting-edge technology to enable medical device management, healthcare companies need to standardize the integration with 3rd-party devices and monitoring tools.

BENEFITS AND ADVANTAGES OF

Leveraging Mia-Care and Medisanté Platform together

Healthcare professionals and experts who look for a new way to extract value from medical device monitoring have to tear down the idea of building from scratch as well as buy off-the-shelf products.

They have to aspire to a new way of thinking by adopting Mia-Care to develop new digital healthcare solutions improving the quality and access to care services and Medisanté to enable the maximum level of interoperability when seamless communication with medical devices is needed.

DEVELOP FAST

Accelerate Time-to-market with ready-to-use set of Microservices and API

DEVELOP SMART

Reduce the cost of Configuration and Maintenance versus developing a custom solution

DEVELOP SECURE

Scale the new marketing opportunities leveraging a secure and compliant solution

Bringing a secure and global cellular IoT connectivity to the home

Keeping the device experience seamless and secure at scale

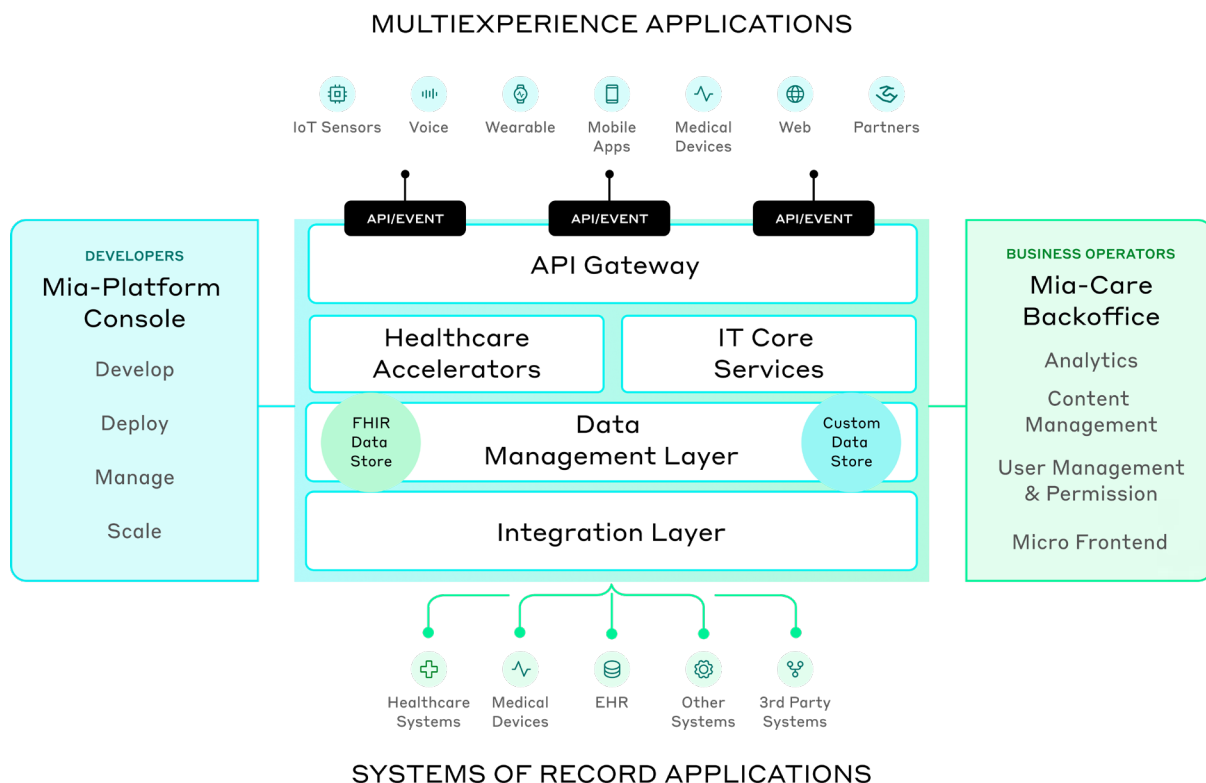

Enabling care teams to scale RPM and DCT in the platform of their choice

STREAMLINE THE DEVELOPMENT OF

Cloud-based healthcare applications

Mia-Care is a microservices-based Platform Builder that enables the creation of composable software bricks developed to address digital challenges within the healthcare space.

The cutting-edge software suite contains unique capabilities and resources to seamlessly design, build, deliver and orchestrate digital services by leveraging a composable architecture approach. The solution is compliant by design with security and privacy regulations for EU and US applications and allows easy integration with external infrastructures.

Mia-Care

enhanced by the excellence of Mia-Platform, is the perfect solution for healthcare providers who want to build an interconnected ecosystem dedicated to improving and anticipating the next patient's needs.

UNLOCK THE POWER OF YOUR DATA

Thanks to Mia-Platform Fast Data you can extract fragmented data spread in silos and organize it to leverage real-time information with Mia-Platform Fast Data that aims to:

- Offload legacy systems
- Centralize data from different sources
- Decrease the elapsed time for request-based information

DEVELOP NEW APPLICATIONS

Leverage the Internal Developer Portal to industrialize and simplify cloud-native applications development and enjoy a rich Marketplace of ready-to-use components to accelerate the pace of healthcare services development by significantly decreasing the time-to-market.

ENABLE COMMERCIAL AND TECHNOLOGY PARTNERSHIPS

Leverage a secure API Gateway to connect services to the ecosystem and expose APIs for your channels and partners. Thanks to defined rules for endpoint regulation, it is possible to integrate with other partners, such as Medisanté, that provide deep expertise for specific use cases.

FOCUS ON PATIENT AND DOCTOR EXPERIENCE

Leverage a fully configurable Backoffice to easily manage multi-tenant configuration, user registration, authorization, and permissions. Mia-Care Backoffice manages contents with a micro-frontend orchestrator for data visualization, and finally, allows you to build a new custom Front-end for different use cases.

BUILD CERTIFIED SOFTWARE AS A MEDICAL DEVICE

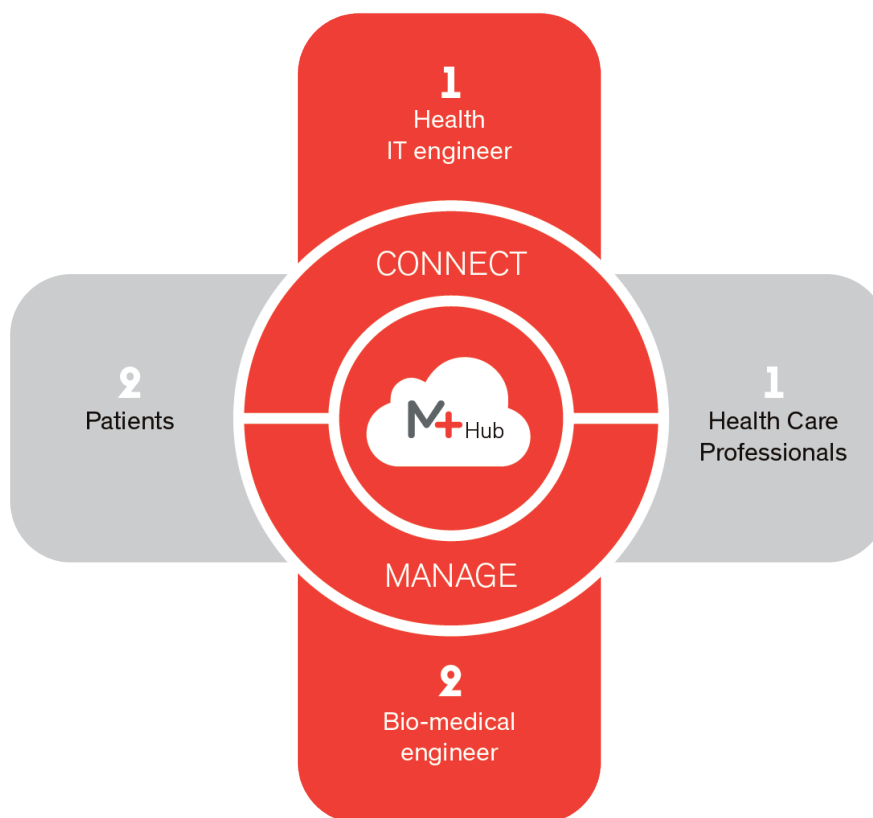

With a guided development experience based on best practices for medical software development, Mia-Care propels MedTech companies into an era of patient-focused solutions. This paper underscores the challenges in building Software as a Medical Device and Mia-Care's role in harmonizing innovation and regulation, ensuring healthcare's technological forefront.

MANAGE ALL OF

Your medical devices from one single place

Medisanté empowers connected care by putting the Internet of Things (IoT) to work for care teams. It allows healthcare providers and clinical research organizations (CROs) to scale remote patient monitoring (RPM) and virtual clinical trials (VCTs) by simplifying device deployment.

M+ Hub, its vendor-agnostic device cloud, securely delivers medical IoT as-a-service straight over a global cellular network to any target health IT system. Such a streamlined data collection reduces the overall device deployment cost by 50% at scale.

CONNECT IOT DEVICES AT SCALE

Health Care Professionals (HCPs)

HCPs can onboard patients in **less than a minute** by simply assigning a device ID to a patient by the swipe of a barcode in their compliant health IT system. **HCPs leverage the compliance of their health IT system** to collect valuable data from their remote patients without jeopardizing data privacy.

Patients

Patients benefit from a zero-touch device configuration. They don't have to download a mobile app, enter their credentials, or pair the device with a cellular gateway. Readings are transmitted automatically to the health IT system where the medical device was assigned by an HCP.

MANAGE IOT DEVICES AT SCALE

Health IT engineers

Medisanté's device cloud offers IT plug-and-play interoperability with their health IT system across multiple vendor silos. All cellular-enabled devices that are assigned to a patient in such a «target system» seamlessly send data to it via FHIR and authentication methods by reducing the risks of cyber-attacks thanks to the strong technology framework used.

Biomedical engineers

Biomedical engineers can track both asset information and dynamic device health attributes straight over a cellular network. They expand proven in-hospital expertise beyond their four walls and receive kudos for it from HCPs who mostly struggle with consumer gadgets.

Engineers in charge of deploying devices of multiple types effectively shield HCPs from technical issues such as low battery, low signal strength, and connectivity issues and help minimize help desk support costs.
